Dialysis is a process of helping patients to eliminate waste and excess fluids by filtering their blood. When kidneys fail or stop working properly, dialysis is used for diverting blood into a machine for cleaning and keeping the body system chemically well-balanced. Usually, the kidneys help in filtering the blood while removing unwanted products and [...]

What is Dialysis?

Chronic renal failure is a progressive disease characterized by a gradual destruction of nephrons and a consequent reduction of kidney function. End-stage renal disease (ESRD) necessitates renal replacement therapy as peritoneal dialysis, hemodialysis, or transplantation. Patients affected by ESRD or in hemodialysis are at risk for developing a number of comorbidities including hypertension ...
